# **Introducing pmtables**

Author: Metrum Research Group

Date: 2021-03-06

pmtables version: 0.3.2.9100

**Introduction**: This is a simple introduction to the pmtables package for R. I hope this will be useful for those

who are new to the package and those who just need a reminder on the syntax.

# **Contents**

# 1 A simple table: stable

#### 1.1 Syntax

Pass your data.frame into stable()

```
stable(data)
```

Other formal arguments include:

- · align to set column alignment
- panel to create groups of rows under a "panel" header
- span to group columns under a "spanner" header
- · notes to create table notes
- sumrows to insert summary rows
- units that get placed below the corresponding column name
- **drop** to omit certain columns from the table
- · sizes to set different table size attributes
- escape\_fun a function to sanitize table items

You can also pass a bunch of other arguments through . . . to further format the table (see ?stable for details)

#### 1.2 Basics

stable() is the name of the workhorse function that is used to turn data.frames into TeX tables. This chapter will introduce the stable() function and how to us it to create basic tables.

To illustrate usage and features of stable(), we will use the stdata data set that comes with pmtables

```
data <- stdata()
head(data)</pre>
```

```

                                 76.6 99.2 22.8 4.54 1.15
```

We can turn this data frame into a TeX table by passing it into stable().

```
out <- stable(data)
head(out, n = 10)</pre>
```

```
. [1] "\\setlength{\\tabcolsep}{5pt} "
```

- . [2] "\\begin{threeparttable}"
- . [3] "\\renewcommand{\\arraystretch}{1.3}"
- . [4] "\\begin{tabular}[h]{11111111}"
- . [5] "\\hline"
- . [6] "STUDY & DOSE & FORM & N & WT & CRCL & AGE & ALB & SCR \\\"
- . [7] "\\hline"
- [8] "12-DEMO-001 & 100 mg & tablet & 80 & 71.4 & 104 & 33.7 & 4.20 & 1.06 \\\"
- . [9] "12-DEMO-001 & 150 mg & capsule & 16 & 89.4 & 122 & 24.4 & 4.63 & 1.12 \\\"
- [10] "12-DEMO-001 & 150 mg & tablet & 48 & 81.7 & 104 & 34.4 & 3.83 & 0.910 \\\"

Note that we have shown the raw latex code that is generated by stable(). That is to say: the output from stable() is a character vector of latex code for the table. Note also that this character vector has a special class associated with it: stable. That means we can write functions that recognize this character vector as output from stable() and we can have those functions process the character vector in special ways.

We can render that table in TeX in the current Rmarkdown document by passing the text to st\_asis().

```
out %>% st asis()
```

| 12-DEMO-002 | 75 mg  | troche  | 36  | 73.6 | 103  | 49.2 | 4.52 | 0.930 |

Remember to only call st\_asis() when you are rendering tables inline in an Rmd document. If you are sending table code to a TeX report, then you will save them to a file and then include them into your report.

The remaining sections of this chapter will show you how to modify and enhance this output in the more basic ways. We will implement separate chapters for more complicated table manipulations.

#### 1.3 Annotate with file names

pmtables can track and annotate your table with the filenames of the R code that generated the table (r\_file) as well as the output file where you write the table .tex code (output\_file).

To have pmtables annotate your table with these file names, pass them in with the  $r_{file}$  and  $output_{file}$  arguments

```
out <- stable(data, r_file = "tables.R", output_file = "tables.tex")</pre>
```

When we look at the rendered table, these names will show up as annotations at the bottom of the table

```
out %>% st_asis()
```

Source code: tables.R Source file: tables.tex

# 1.4 Saving your stable

Saving your stable can be as easy as sending it into writeLines()

```
writeLines(out, con = tempfile(tmpdir = '.', fileext = ".tex"))
```

But remember that we passed in the output\_file argument to stable() and we can use that data to save the table code to the file we named in that argument.

Note that our stable object has another attribute now called stable\_file

attributes(out)

- . \$class
- . [1] "stable"

. \$stable\_file

. [1] "tables.tex"

This has the value that we passed in as output\_file. To save our table to stable\_file, we call stable\_save()

```
stable_save(out)
```

There is a dir argument to stable\_save() that we can use to to select the directory where the file will be saved

```
stable_save(out, dir = tempdir())
```

And if you look at the default value for dir in ?stable\_save, you'll see that this is associated with an option called pmtables.dir; you can set that option to your default output directory and your tables will be saved there until you change that

```
options(pmtables.dir = tempdir())
stable_save(out)
```

## 1.5 Align columns

Use the align argument to align column data to the left, center or right. Use a cols\_\* function to specify the default alignment for all columns

```
tmp <- tibble(AB = 1, CDEFGHIJ = 2, KL = 3)
stable(tmp, align = cols_center()) %>% st_asis()
```

| AB | CDEFGHIJ | KL |
|----|----------|----|
| 1  | 2        | 3  |

You can pass in exceptions to the default

```
stable(tmp, align = cols_center(CDEFGHIJ = "r")) %>% st_asis()
```

| AB | CDEFGHIJ | KL |
|----|----------|----|
| 1  | 2        | 3  |

Or you can pass an alignment directive and the columns that are bound by that directive

```
stable(tmp, align = cols_center(.1 = "AB,KL")) %>% st_asis()
```

| AB | CDEFGHIJ | KL |  |  |
|----|----------|----|--|--|
| 1  | 2        | 3  |  |  |

A special directive called .outer lets you specify the alignment of the first and last column in the table. For example, this code puts the first column to the left and the last column to the right.

```
stable(tmp, align = cols_center(.outer = "lr")) %>% st_asis()
```

| AB | AB CDEFGHIJ |   |  |  |  |
|----|-------------|---|--|--|--|
| 1  | 2           | 3 |  |  |  |

#### 1.5.1 Fixed column widths

Use col\_ragged(size) to force a column to be a fixed size.

```
stable(tmp, align = cols_center(AB = col_ragged(2))) %>% st_asis()
```

| AB | CDEFGHIJ | KL |  |
|----|----------|----|--|
| 1  | 2        | 3  |  |

By default, the unit is cm so that the first column (AB) has a width of 2 cm regardless of the contents.

See cols\_align() help topic for more information and argument descriptions.

## 1.6 Manipulating columns and names

#### 1.6.1 Rename columns

You can change the name that appears in the rendered table with cols\_rename

```
data %>%
  slice(1:3) %>%
  stable(cols_rename = c(Age = "AGE", Weight = "WT")) %>%
  st_asis()
```

| STUDY       | DOSE   | FORM    | N  | Weight | CRCL | Age  | ALB  | SCR   |
|-------------|--------|---------|----|--------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | tablet  | 80 | 71.4   | 104  | 33.7 | 4.20 | 1.06  |
| 12-DEMO-001 | 150 mg | capsule | 16 | 89.4   | 122  | 24.4 | 4.63 | 1.12  |
| 12-DEMO-001 | 150 mg | tablet  | 48 | 81.7   | 104  | 34.4 | 3.83 | 0.910 |

Note that the rename syntax follows the tidyselect convention of putting the new name on the left and the old name on the right.

#### 1.6.2 Hide a column name

You can also "erase" the name of a column in the output

```
data %>%
  slice(1:3) %>%
  stable(cols_blank = "WT,ALB,SCR") %>%
  st_asis()
```

| STUDY       | DOSE   | FORM    | N  |      | CRCL | AGE  |      |       |
|-------------|--------|---------|----|------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | tablet  | 80 | 71.4 | 104  | 33.7 | 4.20 | 1.06  |
| 12-DEMO-001 | 150 mg | capsule | 16 | 89.4 | 122  | 24.4 | 4.63 | 1.12  |
| 12-DEMO-001 | 150 mg | tablet  | 48 | 81.7 | 104  | 34.4 | 3.83 | 0.910 |

#### 1.6.3 Unmask column names

In tibbles, you can't have duplicate column names. The cols\_split argument lets you unmask the names when duplicate names are prefixed with a tag and a delimiter

```
tmp <- tibble(a.A = 1, b.A = 2, c.A = 3)

tmp %>% stable(cols_split = '.') %>% st_asis()
```

#### 1.6.4 Make column names bold

```
data %>% slice(1:2) %>% stable(cols_bold = TRUE) %>% st_asis()
```

| STUDY       | DOSE   | FORM    | N  | WT   | CRCL | AGE  | ALB  | SCR  |
|-------------|--------|---------|----|------|------|------|------|------|
| 12-DEMO-001 | 100 mg | tablet  | 80 | 71.4 | 104  | 33.7 | 4.20 | 1.06 |
| 12-DEMO-001 | 150 mg | capsule | 16 | 89.4 | 122  | 24.4 | 4.63 | 1.12 |

#### 1.6.5 Drop a column from the table

If we want to prevent a column from appearing in the output table (e.g. FORM)

head(data)

```
. # A tibble: 6 x 9
           DOSE
   STUDY
                    FORM
                            N
                                  WT
                                       CRCL AGE
                                                  ALB
                                                        SCR.
              <chr> <chr>
                            <chr> <chr> <chr> <chr> <chr> <chr> <chr>
                                                        1.06
. 1 12-DEMO-001 100 mg tablet 80
                                 71.4 104
                                             33.7 4.20
. 2 12-DEMO-001 150 mg capsule 16
                                 89.4 122
                                             24.4 4.63
                                                        1.12
. 3 12-DEMO-001 150 mg tablet 48
                                 81.7 104
                                             34.4 3.83 0.910
. 4 12-DEMO-001 150 mg troche 16 94.0 93.2 27.4 4.94 1.25
. 5 12-DEMO-001 200 mg tablet 64 67.9 100
                                             27.5 4.25 1.10
. 6 12-DEMO-001 200 mg troche 16
                                 76.6 99.2 22.8 4.54 1.15
```

list the column name as drop

```
stable(data, drop = "FORM") %>% st_asis()
```

| STUDY       | DOSE   | N   | WT   | CRCL | AGE  | ALB  | SCR   |
|-------------|--------|-----|------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | 80  | 71.4 | 104  | 33.7 | 4.20 | 1.06  |
| 12-DEMO-001 | 150 mg | 16  | 89.4 | 122  | 24.4 | 4.63 | 1.12  |
| 12-DEMO-001 | 150 mg | 48  | 81.7 | 104  | 34.4 | 3.83 | 0.910 |
| 12-DEMO-001 | 150 mg | 16  | 94.0 | 93.2 | 27.4 | 4.94 | 1.25  |
| 12-DEMO-001 | 200 mg | 64  | 67.9 | 100  | 27.5 | 4.25 | 1.10  |
| 12-DEMO-001 | 200 mg | 16  | 76.6 | 99.2 | 22.8 | 4.54 | 1.15  |
| 12-DEMO-002 | 100 mg | 36  | 61.3 | 113  | 38.3 | 4.04 | 1.28  |
| 12-DEMO-002 | 100 mg | 324 | 77.6 | 106  | 29.9 | 4.31 | 0.981 |
| 12-DEMO-002 | 50 mg  | 36  | 74.1 | 112  | 37.1 | 4.44 | 0.900 |
| 12-DEMO-002 | 50 mg  | 324 | 71.2 | 106  | 34.1 | 4.63 | 0.868 |
| 12-DEMO-002 | 75 mg  | 36  | 72.4 | 105  | 38.2 | 3.89 | 0.900 |
| 12-DEMO-002 | 75 mg  | 288 | 71.6 | 98.9 | 34.2 | 4.49 | 0.991 |
| 12-DEMO-002 | 75 mg  | 36  | 73.6 | 103  | 49.2 | 4.52 | 0.930 |

Of course some tidyverse could accomplish the same thing

```
data %>% select(-FORM) %>% stable()
```

### 1.7 Other customizations

#### 1.7.1 Notes

Arbitrary notes can get added to any table using the notes argument.

```
data %>%
  slice(1:3) %>%
  stable(notes = "Showing just the first three rows") %>%
  st_asis()
```

| STUDY       | DOSE   | FORM    | N  | WT   | CRCL | AGE  | ALB  | SCR   |
|-------------|--------|---------|----|------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | tablet  | 80 | 71.4 | 104  | 33.7 | 4.20 | 1.06  |
| 12-DEMO-001 | 150 mg | capsule | 16 | 89.4 | 122  | 24.4 | 4.63 | 1.12  |
| 12-DEMO-001 | 150 mg | tablet  | 48 | 81.7 | 104  | 34.4 | 3.83 | 0.910 |

Showing just the first three rows

The appearance of the notes can be controlled by calling noteconf() and passing the result as note\_config. See ?tab\_notes() for more details.

#### 1.7.2 Units

pmtables can automatically place units underneath the appropriate column. To do this, generate a list with names that match the column names you want to label with units.

```
u <- list(
    WT = "kg", CRCL = "ml/min", AGE = "year", ALB = "g/dL",
    SCR = "mg\\\"
) %>% map(~paste0("(", .x, ")"))
```

Then pass that list as units to stable()

```
stable(data, units = u) %>% st_asis()
```

| STUDY       | DOSE   | FORM    | N   | WT<br>(kg) | CRCL (ml/min) | AGE<br>(year) | ALB<br>(g/dL) | SCR<br>(mg%) |
|-------------|--------|---------|-----|------------|---------------|---------------|---------------|--------------|
| 12-DEMO-001 | 100 mg | tablet  | 80  | 71.4       | 104           | 33.7          | 4.20          | 1.06         |
| 12-DEMO-001 | 150 mg | capsule | 16  | 89.4       | 122           | 24.4          | 4.63          | 1.12         |
| 12-DEMO-001 | 150 mg | tablet  | 48  | 81.7       | 104           | 34.4          | 3.83          | 0.910        |
| 12-DEMO-001 | 150 mg | troche  | 16  | 94.0       | 93.2          | 27.4          | 4.94          | 1.25         |
| 12-DEMO-001 | 200 mg | tablet  | 64  | 67.9       | 100           | 27.5          | 4.25          | 1.10         |
| 12-DEMO-001 | 200 mg | troche  | 16  | 76.6       | 99.2          | 22.8          | 4.54          | 1.15         |
| 12-DEMO-002 | 100 mg | capsule | 36  | 61.3       | 113           | 38.3          | 4.04          | 1.28         |
| 12-DEMO-002 | 100 mg | tablet  | 324 | 77.6       | 106           | 29.9          | 4.31          | 0.981        |
| 12-DEMO-002 | 50 mg  | capsule | 36  | 74.1       | 112           | 37.1          | 4.44          | 0.900        |
| 12-DEMO-002 | 50 mg  | tablet  | 324 | 71.2       | 106           | 34.1          | 4.63          | 0.868        |
| 12-DEMO-002 | 75 mg  | capsule | 36  | 72.4       | 105           | 38.2          | 3.89          | 0.900        |
| 12-DEMO-002 | 75 mg  | tablet  | 288 | 71.6       | 98.9          | 34.2          | 4.49          | 0.991        |
| 12-DEMO-002 | 75 mg  | troche  | 36  | 73.6       | 103           | 49.2          | 4.52          | 0.930        |

#### 1.7.3 Multi-line column headers

If the column header is long, you can break it across multiple lines. By default, use . . . in the column name

```
tibble(`First line ... Second line` = 123456789) %>%
  stable() %>% st_asis()
```

First line Second line 123456789

The break can be introduced through the rename mechanism

```
tibble(a = 1) %>%
  stable(cols_rename = c(`First ... Second` = "a")) %>%
  st_asis()
```

```
First
Second
```

Look at the ?tab\_cols help topic for the cols\_break argument; this lets you change the character sequence used for the break.

#### 1.7.4 Insert horizontal lines

Pass hlines\_at to insert horizontal lines above specific rows. This can be either logical vector with the same length as the number of rows in the table or a vector of integers.

```
stable(stdata(), hline_at = c(3,5)) %>% st_asis()
```

| STUDY       | DOSE   | FORM    | N   | WT   | CRCL | AGE  | ALB  | SCR   |

| 12-DEMO-002 | 100 mg | capsule | 36  | 61.3 | 113  | 38.3 | 4.04 | 1.28  |
| 12-DEMO-002 | 100 mg | tablet  | 324 | 77.6 | 106  | 29.9 | 4.31 | 0.981 |
| 12-DEMO-002 | 50 mg  | capsule | 36  | 74.1 | 112  | 37.1 | 4.44 | 0.900 |
| 12-DEMO-002 | 50 mg  | tablet  | 324 | 71.2 | 106  | 34.1 | 4.63 | 0.868 |
| 12-DEMO-002 | 75 mg  | capsule | 36  | 72.4 | 105  | 38.2 | 3.89 | 0.900 |
| 12-DEMO-002 | 75 mg  | tablet  | 288 | 71.6 | 98.9 | 34.2 | 4.49 | 0.991 |
| 12-DEMO-002 | 75 mg  | troche  | 36  | 73.6 | 103  | 49.2 | 4.52 | 0.930 |

Pass hlines\_from to derive hline locations based on non-repeating values in a table column. Notice how this behaves.

```
stable(stdata(), hline_from = "DOSE") %>% st_asis()
```

| STUDY       | DOSE   | FORM    | N   | WT   | CRCL | AGE  | ALB  | SCR   |
|-------------|--------|---------|-----|------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | tablet  | 80  | 71.4 | 104  | 33.7 | 4.20 | 1.06  |
| 12-DEMO-001 | 150 mg | capsule | 16  | 89.4 | 122  | 24.4 | 4.63 | 1.12  |
| 12-DEMO-001 | 150 mg | tablet  | 48  | 81.7 | 104  | 34.4 | 3.83 | 0.910 |
| 12-DEMO-001 | 150 mg | troche  | 16  | 94.0 | 93.2 | 27.4 | 4.94 | 1.25  |
| 12-DEMO-001 | 200 mg | tablet  | 64  | 67.9 | 100  | 27.5 | 4.25 | 1.10  |
| 12-DEMO-001 | 200 mg | troche  | 16  | 76.6 | 99.2 | 22.8 | 4.54 | 1.15  |
| 12-DEMO-002 | 100 mg | capsule | 36  | 61.3 | 113  | 38.3 | 4.04 | 1.28  |
| 12-DEMO-002 | 100 mg | tablet  | 324 | 77.6 | 106  | 29.9 | 4.31 | 0.981 |
| 12-DEMO-002 | 50 mg  | capsule | 36  | 74.1 | 112  | 37.1 | 4.44 | 0.900 |
| 12-DEMO-002 | 50 mg  | tablet  | 324 | 71.2 | 106  | 34.1 | 4.63 | 0.868 |
| 12-DEMO-002 | 75 mg  | capsule | 36  | 72.4 | 105  | 38.2 | 3.89 | 0.900 |
| 12-DEMO-002 | 75 mg  | tablet  | 288 | 71.6 | 98.9 | 34.2 | 4.49 | 0.991 |
| 12-DEMO-002 | 75 mg  | troche  | 36  | 73.6 | 103  | 49.2 | 4.52 | 0.930 |
|             |        |         |     |      |      |      |      |       |

See the ?tab\_hlines help topic for more info. See also st\_hline() for the pipe equivalent with additional feature.

## 1.7.5 Clear replicate values

You can create groups in a table by "clearing" replicate values

```
stable(stdata(), clear_reps = "STUDY") %>% st_asis()
```

| STUDY       | DOSE   | FORM    | N   | WT   | CRCL | AGE  | ALB  | SCR   |
|-------------|--------|---------|-----|------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | tablet  | 80  | 71.4 | 104  | 33.7 | 4.20 | 1.06  |
|             | 150 mg | capsule | 16  | 89.4 | 122  | 24.4 | 4.63 | 1.12  |
|             | 150 mg | tablet  | 48  | 81.7 | 104  | 34.4 | 3.83 | 0.910 |
|             | 150 mg | troche  | 16  | 94.0 | 93.2 | 27.4 | 4.94 | 1.25  |
|             | 200 mg | tablet  | 64  | 67.9 | 100  | 27.5 | 4.25 | 1.10  |
|             | 200 mg | troche  | 16  | 76.6 | 99.2 | 22.8 | 4.54 | 1.15  |
| 12-DEMO-002 | 100 mg | capsule | 36  | 61.3 | 113  | 38.3 | 4.04 | 1.28  |
|             | 100 mg | tablet  | 324 | 77.6 | 106  | 29.9 | 4.31 | 0.981 |
|             | 50 mg  | capsule | 36  | 74.1 | 112  | 37.1 | 4.44 | 0.900 |
|             | 50 mg  | tablet  | 324 | 71.2 | 106  | 34.1 | 4.63 | 0.868 |
|             | 75 mg  | capsule | 36  | 72.4 | 105  | 38.2 | 3.89 | 0.900 |
|             | 75 mg  | tablet  | 288 | 71.6 | 98.9 | 34.2 | 4.49 | 0.991 |
|             | 75 mg  | troche  | 36  | 73.6 | 103  | 49.2 | 4.52 | 0.930 |

This can be combined with an hline

```
stable(stdata(), clear_reps = "STUDY", hline_from = "STUDY") %>%
  st_asis()
```

| STUDY       | DOSE   | FORM    | N   | WT   | CRCL | AGE  | ALB  | SCR   |
|-------------|--------|---------|-----|------|------|------|------|-------|
| 12-DEMO-001 | 100 mg | tablet  | 80  | 71.4 | 104  | 33.7 | 4.20 | 1.06  |
|             | 150 mg | capsule | 16  | 89.4 | 122  | 24.4 | 4.63 | 1.12  |
|             | 150 mg | tablet  | 48  | 81.7 | 104  | 34.4 | 3.83 | 0.910 |
|             | 150 mg | troche  | 16  | 94.0 | 93.2 | 27.4 | 4.94 | 1.25  |
|             | 200 mg | tablet  | 64  | 67.9 | 100  | 27.5 | 4.25 | 1.10  |
|             | 200 mg | troche  | 16  | 76.6 | 99.2 | 22.8 | 4.54 | 1.15  |
| 12-DEMO-002 | 100 mg | capsule | 36  | 61.3 | 113  | 38.3 | 4.04 | 1.28  |
|             | 100 mg | tablet  | 324 | 77.6 | 106  | 29.9 | 4.31 | 0.981 |
|             | 50 mg  | capsule | 36  | 74.1 | 112  | 37.1 | 4.44 | 0.900 |
|             | 50 mg  | tablet  | 324 | 71.2 | 106  | 34.1 | 4.63 | 0.868 |
|             | 75 mg  | capsule | 36  | 72.4 | 105  | 38.2 | 3.89 | 0.900 |
|             | 75 mg  | tablet  | 288 | 71.6 | 98.9 | 34.2 | 4.49 | 0.991 |
|             | 75 mg  | troche  | 36  | 73.6 | 103  | 49.2 | 4.52 | 0.930 |
|             |        |         |     |      |      |      |      |       |

 $See \verb|?tab_clear_reps| for other options|, including an option for clearing based on several grouping variables|.$ 

# 2 Group table rows with panel

#### 2.1 Syntax

To panel a table by STUDY

```
stable(stdata(), panel = "STUDY")
```

To set a prefix for the panel header:

```
stable(stdata(), panel = as.panel("STUDY", prefix = "Study: "))
```

#### 2.2 Basics

Paneling your table is a way to group sets of rows together into a "panel" with a panel header rendered in bold font. For example, we can panel a table of mtcars by carb. We will be working with an abbreviated version of mtcars:

```
smcars
```

```
name mpg cyl disp hp drat
                                                      wt qsec vs am gear
. Datsun 710
                 Datsun 710 22.8 4 108.0 93 3.85 2.320 18.61 1 1
                                                                       4
. Hornet 4 Drive Hornet 4 Drive 21.4 6 258.0 110 3.08 3.215 19.44 1 0
                                                                       3
. Valiant
                    Valiant 18.1 6 225.0 105 2.76 3.460 20.22 1 0
. Fiat 128
                    Fiat 128 32.4 4 78.7 66 4.08 2.200 19.47 1 1
. Toyota Corolla Toyota Corolla 33.9 4 71.1 65 4.22 1.835 19.90 1 1
. Toyota Corona \, Toyota Corona \, 21.5 \, 4 \, 120.1 \, 97 \, 3.70 \, 2.465 \, 20.01 \, 1 \, 0
                Fiat X1-9 27.3 4 79.0 66 4.08 1.935 18.90 1 1
. Fiat X1-9
. Merc 240D
                   Merc 240D 24.4 4 146.7 62 3.69 3.190 20.00 1 0
. Merc 230
                    Merc 230 22.8 4 140.8 95 3.92 3.150 22.90 1 0
                                                                       4
. Honda Civic
                Honda Civic 30.4 4 75.7 52 4.93 1.615 18.52 1 1
               carb
. Datsun 710
                  1
. Hornet 4 Drive
                  1
. Valiant
. Fiat 128
                 1
. Toyota Corolla
                  1
. Toyota Corona
                  1
. Fiat X1-9
                  2
. Merc 240D
. Merc 230
                  2
. Honda Civic
                  2
```

Then we pass into stable() and name the paneling column:

```
smcars %>% stable(panel = "carb") %>% st_asis()
```

| name           | mpg  | cyl | disp  | hp  | drat | wt    | qsec  | vs | am | gear |
|----------------|------|-----|-------|-----|------|-------|-------|----|----|------|
| 1              |      |     |       |     |      |       |       |    |    |      |
| Datsun 710     | 22.8 | 4   | 108   | 93  | 3.85 | 2.32  | 18.61 | 1  | 1  | 4    |
| Hornet 4 Drive | 21.4 | 6   | 258   | 110 | 3.08 | 3.215 | 19.44 | 1  | 0  | 3    |
| Valiant        | 18.1 | 6   | 225   | 105 | 2.76 | 3.46  | 20.22 | 1  | 0  | 3    |
| Fiat 128       | 32.4 | 4   | 78.7  | 66  | 4.08 | 2.2   | 19.47 | 1  | 1  | 4    |
| Toyota Corolla | 33.9 | 4   | 71.1  | 65  | 4.22 | 1.835 | 19.9  | 1  | 1  | 4    |
| Toyota Corona  | 21.5 | 4   | 120.1 | 97  | 3.7  | 2.465 | 20.01 | 1  | 0  | 3    |
| Fiat X1-9      | 27.3 | 4   | 79    | 66  | 4.08 | 1.935 | 18.9  | 1  | 1  | 4    |
| 2              |      |     |       |     |      |       |       |    |    |      |
| Merc 240D      | 24.4 | 4   | 146.7 | 62  | 3.69 | 3.19  | 20    | 1  | 0  | 4    |
| Merc 230       | 22.8 | 4   | 140.8 | 95  | 3.92 | 3.15  | 22.9  | 1  | 0  | 4    |
| Honda Civic    | 30.4 | 4   | 75.7  | 52  | 4.93 | 1.615 | 18.52 | 1  | 1  | 4    |

Now, all of the carb==1 rows are grouped with the heading 1 and similarly the carb==2 rows are grouped with the heading 2 in bold.

This is ok, but a more informative heading would be helpful. To do this, we'll call as . panel() to both name the panel column and set some options:

```
smcars %>% stable(panel = as.panel("carb", prefix = "carb: ")) %>% st_asis()
```

| name           | mpg  | cyl | disp  | hp  | drat | wt    | qsec  | vs | am | gear |
|----------------|------|-----|-------|-----|------|-------|-------|----|----|------|
| carb: 1        |      |     |       |     |      |       |       |    |    |      |
| Datsun 710     | 22.8 | 4   | 108   | 93  | 3.85 | 2.32  | 18.61 | 1  | 1  | 4    |
| Hornet 4 Drive | 21.4 | 6   | 258   | 110 | 3.08 | 3.215 | 19.44 | 1  | 0  | 3    |
| Valiant        | 18.1 | 6   | 225   | 105 | 2.76 | 3.46  | 20.22 | 1  | 0  | 3    |
| Fiat 128       | 32.4 | 4   | 78.7  | 66  | 4.08 | 2.2   | 19.47 | 1  | 1  | 4    |
| Toyota Corolla | 33.9 | 4   | 71.1  | 65  | 4.22 | 1.835 | 19.9  | 1  | 1  | 4    |
| Toyota Corona  | 21.5 | 4   | 120.1 | 97  | 3.7  | 2.465 | 20.01 | 1  | 0  | 3    |
| Fiat X1-9      | 27.3 | 4   | 79    | 66  | 4.08 | 1.935 | 18.9  | 1  | 1  | 4    |
| carb: 2        |      |     |       |     |      |       |       |    |    |      |
| Merc 240D      | 24.4 | 4   | 146.7 | 62  | 3.69 | 3.19  | 20    | 1  | 0  | 4    |
| Merc 230       | 22.8 | 4   | 140.8 | 95  | 3.92 | 3.15  | 22.9  | 1  | 0  | 4    |
| Honda Civic    | 30.4 | 4   | 75.7  | 52  | 4.93 | 1.615 | 18.52 | 1  | 1  | 4    |

Note that the prefix is completely specified by the user (including any spaces or a colon.

## 2.3 panel: important points

- 1. Most of the time, the data frame should be sorted by the panel column
- 2. pmtables creates panels by non-repeating values in the panel column; there will be an error if duplicate panel names are found and this can be overridden by passing duplicates\_ok to as.panel().

# 3 Group table columns with spanners

#### 3.1 Syntax

Set the span argument to the output of as.span(). The key arguments for as.span() are the spanner title and the names of the columns over which you want the spanner to run

```
stable(stdata(), span = as.span("Covariates", WT:SCR))
The equivalent pipe syntax is
st_new(stdata()) %>% st_span("Covariates", WT:SCR)
```

#### 3.2 Basics

A column spanner puts a horizontal line over a sequence of column names and places a title above that line forming a column group.

As a trivial example:

```
data <-
  tibble(
   Tariffville = "06081", Connecticut= "CT",
   Minnesota = "MN", Minneapolis = "55455"
)
data %>% stable(span = as.span("States", Connecticut:Minnesota)) %>% st_asis()
```

|             | es          |             |       |
|-------------|-------------|-------------|-------|
| Tariffville | Connecticut | Minneapolis |       |
| 06081       | CT          | MN          | 55455 |

## 3.3 Multiple spanners

Multiple spanners can be added to a table by specifying the level for any spanner that you want to be placed above the lowest level spanner. For example,

```
sp <- list(
  as.span("States", Connecticut:Minnesota),
  as.span("The Universe", Tariffville:Minneapolis, level = 2)
)
data %>% stable(span = sp) %>% st_asis()
```

| The Universe |             |           |             |  |  |  |  |  |
|--------------|-------------|-----------|-------------|--|--|--|--|--|
|              | States      |           |             |  |  |  |  |  |
| Tariffville  | Connecticut | Minnesota | Minneapolis |  |  |  |  |  |
| 06081        | CT          | MN        | 55455       |  |  |  |  |  |

Note that to specify multiple spanners, we pass a list of span objects. I've simplified the code a bit here by creating that list as a standalone object and then passing the whole list as span.

#### 3.3.1 Using pipe syntax

For problems like this, it might be preferable to use the pipe syntax

```
data %>%
  st_new() %>%
  st_span("States", Connecticut:Minnesota) %>%
  st_span("The Universe", Tariffville:Minneapolis, level = 2) %>%
  stable() %>%
  st_asis()
```

| The Universe      |                                   |  |  |  |  |  |  |  |  |  |
|-------------------|-----------------------------------|--|--|--|--|--|--|--|--|--|
|                   | States                            |  |  |  |  |  |  |  |  |  |
| Tariffville       | Tariffville Connecticut Minnesota |  |  |  |  |  |  |  |  |  |
| 06081 CT MN 55455 |                                   |  |  |  |  |  |  |  |  |  |

## 3.4 Breaking span title

We can make the title of the span break across multiple lines by using . . .

```
stable(data, span = as.span("Example ... States", Connecticut:Minnesota)) %>%
    st_asis()
```

| Example<br>States |             |                       |       |  |  |  |  |  |
|-------------------|-------------|-----------------------|-------|--|--|--|--|--|
| Tariffville       | Connecticut | Connecticut Minnesota |       |  |  |  |  |  |
| 06081             | CT          | MN                    | 55455 |  |  |  |  |  |

# 4 Tables that span multiple pages: longtable

## 4.1 Syntax

To create a long table from a data frame

```
stable_long(stdata())
```

To create a long table from pipeline

```
st_new(data) %>% stable_long()
```

To create a long table from pmtable

```
pt_cont_long(data, cols = "WT,EGFR") %>% stable_long()
```

#### 4.2 Basics

You can create longtables that span multiple pages of your pdf document. Tables using thelongtable environment are very different than the basic table from stable() which are built using tabular environment.

## 4.3 Inserting longtable into your latex document

Once you have written your long table out to a file, you can source it into your latex document with a simple input command

```
\input{my-table.tex}
```

You should not wrap your longtable input code in \begin{table}/\end{table} as you would with a regular table.

# 5 The pipe interface

#### 5.1 Basics

Mostly working with this data; but some others come in later to illustrate certain features.

```
data <- pmt_summarized
head(data)</pre>
```

```
. # A tibble: 6 x 9
   STUDY
             DOSE FORM
                                        CRCL AGE
                                                   ALB
             <chr> <chr>
   <chr>
. 1 12-DEMO-001 100 mg tablet 80 71.4 104
                                             33.7 4.20 1.06
. 2 12-DEMO-001 150 mg capsule 16 89.4 122
                                             24.4 4.63 1.12
. 3 12-DEMO-001 150 mg tablet 48 81.7 104
                                             34.4 3.83 0.910
. 4 12-DEMO-001 150 mg troche 16 94.0 93.2 27.4 4.94 1.25
. 5 12-DEMO-001 200 mg tablet 64 67.9 100
                                             27.5 4.25 1.10
. 6 12-DEMO-001 200 mg troche 16 76.6 99.2 22.8 4.54 1.15
```

You start out a pipeline by passing your data frame into st\_new()

```
data %>% st_new() %>% class
```

```
. [1] "stobject" "environment"
```

This creates an object that gets revised by subsequent steps in the pipeline, adding features and styling as you go.

For the final step in the pipeline, we'll send the object to stable() to create the table

```
data %>% st_new() %>% stable() %>% head(n=9)
```

- . [1] "\\setlength{\\tabcolsep}{5pt} "
- . [2] "\\begin{threeparttable}"
- . [3] "\\renewcommand{\\arraystretch}{1.3}"
- . [4] "\\begin{tabular}[h]{llllllll}"
- . [5] "\\hline"
- . [6] "STUDY & DOSE & FORM & N & WT & CRCL & AGE & ALB & SCR \\\"
- . [7] "\\hline"
- . [8] "12-DEMO-001 & 100 mg & tablet & 80 & 71.4 & 104 & 33.7 & 4.20 & 1.06 \\\"
- . [9] "12-DEMO-001 & 150 mg & capsule & 16 & 89.4 & 122 & 24.4 & 4.63 & 1.12 \\\"

## 5.2 Simple table

You can terminate the pipeline and create a tabular table by sending to stable()

```
data %>% st_new() %>% stable()
```

Equivalent call

```
data %>% stable()
```

## 5.3 Long table

You can also pipe to stable\_long() to make a long table

```
data %>% st_new() %>% stable_long()
```

#### 5.4 Annotate with file names

```
st_new(data) %>% st_files(r = "foo.R", output = "foo.tex")
```

Equivalent call

```
stable(data, r_file = "foo.R", output_file = "foo.tex")
```

Note that in the pipe version, we already have file in the function name so that gets dropped from the argument name.

#### 5.5 Save a table

First convert with stable() or stable\_long() then save with stable\_save()

```
st_new(data) %>%
st_files(output = "foo.tex") %>%
stable() %>%
stable_save()
```

## 5.6 Align columns

stable()

```
• st_center(...)
• st_left(...)
• st_right(...)
• st_align(...)

st_new(data) %>%
st_center() %>%
```

Equivalent call

```
stable(data, align = cols_center())
```

## 5.7 Rename columns

```
st_new(data) %>%
st_rename(Weight = "WT") %>%
stable()
```

Equivalent call

```
stable(data, cols_rename = c(Weight = "WT"))
```

## 5.8 Blank columns

```
st_new(data) %>% st_blank(WT, ALB, DOSE) %>% stable()
```

Equivalent call

```
stable(data, cols_blank = "WT,ALB,DOSE")
```

## 5.9 Drop columns

```
st_new(data) %>% st_drop(WT, ALB, DOSE) %>% stable()
```

Equivalent call

```
stable(data, drop = "WT, ALB, DOSE")
```

#### **5.10** Notes

• Multiple calls are allowed; notes will accumulate

```
st_new(data) %>%
st_notes("first note") %>%
st_nates("second note") %>%
stable()
```

Equivalent call

```
stable(
  data,
  notes = c("first note", "second note")
)
```

#### **5.11 Units**

```
st_new(data) %>%
st_units(WT = "kg", AGE = "years") %>%
stable()
```

Note that  $st\_units()$  will automatically add parens to your units; this can be suppressed with the parens argument.

Units can also be added as a list

```
u <- list(WT = "kg", AGE = "years")

st_new(data) %>%
    st_units(u) %>%
    stable()
```

Equivalent call

```
stable(data, units = u)
```

## **5.12** panel

```
st_new(data) %>%
st_panel("STUDY") %>%
stable()
```

Equivalent call

```
stable(data, panel = "STUDY")
```

## 5.13 span

```
st_new(data) %>%
st_span("Covariates", c(WT, ALB, EGFR)) %>%
stable()
```

Equivalent call

```
stable(data, span = as.span("Covariates", c(WT, ALB, EGFR)))
```

#### **5.14** hlines - at

To put horizontal lines at specific rows

```
st_new(data) \%\% st_hline(at = c(2,4,6))
```

Equivalent call

```
stable(data, hline_at = c(2,4,6))
```

## 5.15 hlines - from

To calculate hlines based on data frame column values (for example, to break the table by changing values of STUDYf)

```
st_new(data) %>% st_hline(from = "STUDYf")
```

Equivalent call

```
stable(data, hline_from = "STUDYf")
```

### 5.16 hlines - pattern

To search the table for a pattern and add hlines above matches

```
st_new(data) %>% st_hline(pattern = "All", cols = "Summary")
```

The cols argument limits the search to the Summary column; omit this argument to search the whole table.

There is no equivalent call for this using straight stable().

#### 5.17 Clear replicate values

To create groups by "clearing" replicate values in a column

```
st_new(data) %>% st_clear_reps(STUDY) %>% stable()
```

Equivalent call

```
stable(data, clear_reps = "STUDY")
```

# 6 Options for previewing the table

#### 6.1 st2report

Take a table or a list of tables and render them in a report-like document with a table of contents and a (faux) caption for each table

```
data %>% stable() %>% st2report()
```

You might try passing ntex to force the document to build more than once (sometimes the layout settles down after the second build

```
data %>% stable() %>% st2report(ntex = 2)
```

Pass in a list of tables and you will get one table on each page with a listing of tables in the table of contents

```
list(table1, table2, table3) %>% st2report()
```

#### 6.2 st2viewer

This function relies on texPreview() to render your table and display it as a graphic in the viewer window

```
data %>% stable() %>% st2viewer()
```

This method is more convenient because the tables always go to the viewer. But the rendering will not be like what you will see in the report.

#### 6.3 st2article

Like st2report() but less report-like. You should use st2report() instead.

```
data %>% stable() %>% st2article()
```

#### 6.4 st2doc

The original. Rather than building a TeX article, it runs the table in a Rmd document via pandoc. Not recommended; it is much slower to get the preview because there has to be a call to pandoc

```
data %>% stable() %>% st2doc()
```

# 7 A word about sanitizing table contents

#### **7.1** Notes

```
x <- ptdata() %>% st_new(notes = "EDA_summary = TRUE") %>%
  st_make(inspect = TRUE) %>%
  get_stable_data()
x$notes
```

. [1] "EDA\\\_summary = TRUE"

#### 7.2 File names

```
x <- ptdata() %>% st_new() %>%
  st_files(r = "my_script.R") %>%
  st_make(inspect = TRUE) %>%
  get_stable_data()

x$notes
```

. [1] "Source code: my\\\_script.R"

#### 7.3 Column names

```
out <-
  tibble(a_1 = 5) %>%
  stable(inspect = TRUE) %>%
  get_stable_data()

out$cols_tex
```

. [1] "a\\\_1 \\\\"

## 7.4 Main table contents

```
out <-
  tibble(a = "5_2") %>%
  stable(inspect = TRUE) %>%
  get_stable_data()
out$tab
```

. [1] "5\\\_2 \\\\"

## 7.5 Span titles

```
out <-
  ptdata() %>%
  stable(inspect = TRUE, span = colgroup("foo_this", WT:SCR)) %>%
  get_stable_data()

out$span_data$tex
```

- . [1] "\\multicolumn{4}{c}{} & \\multicolumn{5}{c}{foo}\\\_this} \\\\"
- $[2] "\cmidrule(lr){5-9}"$

#### 7.6 Panel names

- . [1] "\\multicolumn $\{1\}\{l\}\{\t \{a\t 1\}\}\t$ "
- . [2] "\\hline \\multicolumn{1}{1}{\\textbf{a\\\_2}}\\\\"

## 7.7 cols\_extrainput

```
x <- letters[1:5]
data <- tibble(a = x, b = x, c = x)
xtra <- tibble(a = "foo%", b = "$\\mu$g", c = "1234 \\% %")
out <- stable(data, cols_extra = xtra)
out[grepl("%", out, fixed = TRUE)]</pre>
```

. [1] "foo\\% & \$\\mu\$g & 1234 \\% % \\\\"

# 8 pmtable

#### Some setup

```
units = yspec::ys_get_unit(yspec::ys_help$spec(), parens = TRUE)

data <- pmt_first
data_pk <- pmt_pk
data_all <- pmt_obs</pre>
```

### 8.1 Principles

These functions expect that the user passes in all data that is to be summarized and nothing more. We will not filter your data.

#### 8.2 Rename cols

When you select columns to summarize, you can generally pass in alternate (nicer) names that you want to show up in the table. For example, if I have a column called WT in the data frame and I want it to show up as Weight this can be accomplished during the call

Alternatively, you can use the table argument to enter rename info. Note that table is a list that should have names that match up with columns in the data frame and values that are the new names

```
tab <- list(SEXf = "Sex", ASIANf = "Race group")

pt_cat_wide(data, cols = "SEXf, ASIANf", table = tab) %>%
  stable() %>% st_asis()
```

|     | Se        | ex          | Race      | group     |
|-----|-----------|-------------|-----------|-----------|
| n   | male      | male female |           | non-Asian |
| 160 | 80 (50.0) | 80 (50.0)   | 66 (41.2) | 94 (58.8) |

Summary is count (percent) n: number of records summarized

## 8.3 Data inventory tables

- · Count number of
  - individuals

- observations
- BQL observations
- missing values
- Calculate the percent of observations or BQL in different sub groups

#### 8.3.1 Stacked by endpoint

• The stacked plot creates multiple independent tables to summarize different endpoints; there is no single overall summary for the table because we are summarizing different endpoints

```
out <- pt_data_inventory(
  data_all,
  by = c(Study = "STUDYf"),
  panel = as.panel("SEQf", prefix = "Endpoint: "),
  stacked = TRUE
)

out %>% stable(r_file = "test.R", output_file = "test.tex") %>% st_asis()
```

|                      |       | Num  | ber  |     | Percent |     |
|----------------------|-------|------|------|-----|---------|-----|
| Study                | SUBJ  | MISS | OBS  | BQL | OBS     | BQL |

# 8.4 Wide categorical table

- Summary of categorical data in wide format
- The summary is number (percent within group)
- Wide refers to the fact that the covariates go across the table

## 8.4.0.1 Ungrouped

```
out <- pt_cat_wide(
  data = data,
  cols = vars(Formulation = FORMf, Sex = SEXf, "Race group" = ASIANf)
)
out %>% stable(r_file = "test.R", output_file = "test.tex") %>% st_asis()
```

| Formulation |            |          | Se       | ex        | Race group  |           |           |
|-------------|------------|----------|----------|-----------|-------------|-----------|-----------|
| n           | tablet     | capsule  | troche   | male      | male female |           | non-Asian |
| 160         | 130 (81.2) | 15 (9.4) | 15 (9.4) | 80 (50.0) | 80 (50.0)   | 66 (41.2) | 94 (58.8) |

Summary is count (percent)

n: number of records summarized

## 8.4.1 Paneled (limited utility, IMO)

• Provided here for completeness

```
out <- pt_cat_wide(
  data = data,
  cols = vars(Formulation = FORMf, Sex = SEXf, "Race group" = ASIANf),
  panel = as.panel("STUDYf", prefix = "Study: ")
)
out %>% stable(r_file = "test.R", output_file = "test.tex") %>% st_asis()
```

|       | Fo         | Formulation |          | S         | ex        | Race group |           |
