Introducing pmtables

Author: Kyle Baron **Date**: 2021-03-06 **Version**: 0.3.2.9100

Introduction: This is a simple introduction to the pmtables package for R. I hope this will be useful for those who are new to the package and thos who just need a reminder on the syntax.

1 A simple table: stable

1.1 Syntax

Pass your data.frame into stable()

```
stable(data)
```

Other formal arguments include:

- · align to set column alignment
- panel to create groups of rows under a "panel" header
- span to group columns under a "spanner" header
- · notes to create table notes
- sumrows to insert summary rows
- units that get placed below the corresponding column name
- **drop** to omit certain columns from the table
- · sizes to set different table size attributes
- escape_fun a function to sanitize table items

You can also pass a bunch of other arguments through . . . to further format the table (see ?stable for details)

1.2 Basics

stable() is the name of the workhorse function that is used to turn data.frames into TeX tables. This chapter will introduce the stable() function and how to us it to create basic tables.

To illustrate usage and features of stable(), we will use the stdata data set that comes with pmtables

```
data <- stdata()
head(data)</pre>
```

```
. # A tibble: 6 x 9
         DOSE
   STUDY
                    FORM
                                 WT
                                       CRCL AGE
                                                  ALB
                                                       SCR
   <chr>
             <chr> <chr>
                            <chr> <chr> <chr> <chr> <chr> <chr> <chr>
. 1 12-DEMO-001 100 mg tablet 80 71.4 104
                                            33.7 4.20 1.06
. 2 12-DEMO-001 150 mg capsule 16
                                 89.4 122
                                            24.4 4.63 1.12
. 3 12-DEMO-001 150 mg tablet 48 81.7 104
                                            34.4 3.83 0.910
. 4 12-DEMO-001 150 mg troche 16 94.0 93.2 27.4 4.94 1.25
. 5 12-DEMO-001 200 mg tablet 64
                                 67.9 100
                                            27.5 4.25 1.10
. 6 12-DEMO-001 200 mg troche 16
                                 76.6 99.2 22.8 4.54 1.15
```

We can turn this data frame into a TeX table by passing it into stable().

```
out <- stable(data)
head(out, n = 10)</pre>
```

```
. [1] "\\setlength{\\tabcolsep}{5pt} "
```

- . [2] "\\begin{threeparttable}"
- . [3] "\\renewcommand{\\arraystretch}{1.3}"
- . [4] "\\begin{tabular}[h]{11111111}"
- . [5] "\\hline"
- . [6] "STUDY & DOSE & FORM & N & WT & CRCL & AGE & ALB & SCR \\\"
- . [7] "\\hline"
- . [8] "12-DEMO-001 & 100 mg & tablet & 80 & 71.4 & 104 & 33.7 & 4.20 & 1.06 \\\"
- . [9] "12-DEMO-001 & 150 mg & capsule & 16 & 89.4 & 122 & 24.4 & 4.63 & 1.12 \\\"
- . [10] "12-DEMO-001 & 150 mg & tablet & 48 & 81.7 & 104 & 34.4 & 3.83 & 0.910 \\\"

Note that we have shown the raw latex code that is generated by stable(). That is to say: the output from stable() is a character vector of latex code for the table. Note also that this character vector has a special class associated with it: stable. That means we can write functions that recognize this character vector as output from stable() and we can have those functions process the character vector in special ways.

We can render that table in TeX in the current Rmarkdown document by passing the text to st_asis().

out %>% st asis()

STUDY	DOSE	FORM	N	WT	CRCL	AGE	ALB	SCR

12-DEMO-002	75 mg	troche	36	73.6	103	49.2	4.52	0.930

Remember to only call st_asis() when you are rendering tables inline in an Rmd document. If you are sending table code to a TeX report, then you will save them to a file and then include them into your report.

The remaining sections of this chapter will show you how to modify and enhance this output in the more basic ways. We will implement separate chapters for more complicated table manipulations.

1.3 Annotate with file names

pmtables can track and annotate your table with the filenames of the R code that generated the table (r_file) as well as the output file where you write the table .tex code (output_file).

To have pmtables annotate your table with these file names, pass them in with the r_file and $output_file$ arguments

```
out <- stable(data, r_file = "tables.R", output_file = "tables.tex")</pre>
```

When we look at the rendered table, these names will show up as annotations at the bottom of the table

```
out %>% st_asis()
```

Source code: tables.R Source file: tables.tex

1.4 Saving your stable

Saving your stable can be as easy as sending it into writeLines()

```
writeLines(out, con = tempfile(tmpdir = '.', fileext = ".tex"))
```

But remember that we passed in the output_file argument to stable() and we can use that data to save the table code to the file we named in that argument.

Note that our stable object has another attribute now called stable_file

attributes(out)

- . \$class
- . [1] "stable"

. \$stable_file

. [1] "tables.tex"

This has the value that we passed in as output_file. To save our table to stable_file, we call stable_save()

```
stable_save(out)
```

There is a dir argument to stable_save() that we can use to to select the directory where the file will be saved

```
stable_save(out, dir = tempdir())
```

And if you look at the default value for dir in ?stable_save, you'll see that this is associated with an option called pmtables.dir; you can set that option to your default output directory and your tables will be saved there untill you change that

```
options(pmtables.dir = tempdir())
stable_save(out)
```

1.5 Align columns

Use the align argument to align column data to the left, center or right. Use a cols_* function to specify the default alignment for all columns

```
tmp <- tibble(AB = 1, CDEFGHIJ = 2, KL = 3)
stable(tmp, align = cols_center()) %>% st_asis()
```

AB	CDEFGHIJ	KL
1	2	3

You can pass in exceptions to the default

```
stable(tmp, align = cols_center(CDEFGHIJ = "r")) %>% st_asis()
```

AB	CDEFGHIJ	KL
1	2	3

Or you can pass an alignment directive and the columns that are bound by that directive

```
stable(tmp, align = cols_center(.1 = "AB,KL")) %>% st_asis()
```

AB	CDEFGHIJ	KL
1	2	3

A special directive called .outer lets you specify the alignment of the first and last column in the table. For example, this code puts the first column to the left and the last column to the right.

```
stable(tmp, align = cols_center(.outer = "lr")) %>% st_asis()
```

AB	CDEFGHIJ	KL
1	2	3

1.5.1 Fixed column widths

Use col_ragged(size) to force a column to be a fixed size.

```
stable(tmp, align = cols_center(AB = col_ragged(2))) %>% st_asis()
```

AB	CDEFGHIJ	KL	
1	2	3	

By default, the unit is cm so that the first column (AB) has a width of 2 cm regardless of the contents.

See cols_align() help topic for more information and argument descriptions.

1.6 Manipulating columns and names

1.6.1 Rename columns

You can change the name that appears in the rendered table with cols_rename

```
data %>%
  slice(1:3) %>%
  stable(cols_rename = c(Age = "AGE", Weight = "WT")) %>%
  st_asis()
```

STUDY	DOSE	FORM	N	Weight	CRCL	Age	ALB	SCR
12-DEMO-001	100 mg	tablet	80	71.4	104	33.7	4.20	1.06
12-DEMO-001	150 mg	capsule	16	89.4	122	24.4	4.63	1.12
12-DEMO-001	150 mg	tablet	48	81.7	104	34.4	3.83	0.910

Note that the rename syntax follows the tidyselect convention of putting the new name on the left and the old name on the right.

1.6.2 Hide a column name

You can also "erase" the name of a colum in the output

```
data %>%
  slice(1:3) %>%
  stable(cols_blank = "WT,ALB,SCR") %>%
  st_asis()
```

STUDY	DOSE	FORM	N		CRCL	AGE		
12-DEMO-001	100 mg	tablet	80	71.4	104	33.7	4.20	1.06
12-DEMO-001	150 mg	capsule	16	89.4	122	24.4	4.63	1.12
12-DEMO-001	150 mg	tablet	48	81.7	104	34.4	3.83	0.910

1.6.3 Unmask column names

In tibbles, you can't have duplicate column names. The cols_split argument lets you unmask the names when duplicate names are prefixed with a tag and a delimiter

```
tmp <- tibble(a.A = 1, b.A = 2, c.A = 3)

tmp %>% stable(cols_split = '.') %>% st_asis()
```

1.6.4 Make column names bold

```
data %>% slice(1:2) %>% stable(cols_bold = TRUE) %>% st_asis()
```

STUDY	DOSE	FORM	N	WT	CRCL	AGE	ALB	SCR
12-DEMO-001	100 mg	tablet	80	71.4	104	33.7	4.20	1.06
12-DEMO-001	150 mg	capsule	16	89.4	122	24.4	4.63	1.12

1.6.5 Drop a column from the table

If we want to prevent a column from appearing in the output table (e.g. FORM)

head(data)

```
. # A tibble: 6 x 9
          DOSE FORM
   STUDY
                           N
                                 WT
                                       CRCL AGE
                                                  ALB
                                                       SCR.
             <chr> <chr>
                            <chr> <chr> <chr> <chr> <chr> <chr> <chr>
. 1 12-DEMO-001 100 mg tablet 80
                                 71.4 104
                                            33.7 4.20 1.06
. 2 12-DEMO-001 150 mg capsule 16
                                 89.4 122
                                            24.4 4.63
                                                       1.12
. 3 12-DEMO-001 150 mg tablet 48
                                 81.7 104
                                            34.4 3.83 0.910
. 4 12-DEMO-001 150 mg troche 16 94.0 93.2 27.4 4.94 1.25

. 6 12-DEMO-001 200 mg troche 16
                                 76.6 99.2 22.8 4.54 1.15
```

list the column name as drop

```
stable(data, drop = "FORM") %>% st_asis()
```

STUDY	DOSE	N	WT	CRCL	AGE	ALB	SCR
12-DEMO-001	100 mg	80	71.4	104	33.7	4.20	1.06
12-DEMO-001	150 mg	16	89.4	122	24.4	4.63	1.12
12-DEMO-001	150 mg	48	81.7	104	34.4	3.83	0.910
12-DEMO-001	150 mg	16	94.0	93.2	27.4	4.94	1.25
12-DEMO-001	200 mg	64	67.9	100	27.5	4.25	1.10
12-DEMO-001	200 mg	16	76.6	99.2	22.8	4.54	1.15
12-DEMO-002	100 mg	36	61.3	113	38.3	4.04	1.28
12-DEMO-002	100 mg	324	77.6	106	29.9	4.31	0.981
12-DEMO-002	50 mg	36	74.1	112	37.1	4.44	0.900
12-DEMO-002	50 mg	324	71.2	106	34.1	4.63	0.868
12-DEMO-002	75 mg	36	72.4	105	38.2	3.89	0.900
12-DEMO-002	75 mg	288	71.6	98.9	34.2	4.49	0.991
12-DEMO-002	75 mg	36	73.6	103	49.2	4.52	0.930

Of course some tidyverse could accomplish the same thing

```
data %>% select(-FORM) %>% stable()
```

1.7 Other customizations

1.7.1 Notes

Arbitrary notes can get added to any table using the notes argument.

```
data %>%
  slice(1:3) %>%
  stable(notes = "Showing just the first three rows") %>%
  st_asis()
```

STUDY	DOSE	FORM	N	WT	CRCL	AGE	ALB	SCR
12-DEMO-001	100 mg	tablet	80	71.4	104	33.7	4.20	1.06
12-DEMO-001	150 mg	capsule	16	89.4	122	24.4	4.63	1.12
12-DEMO-001	150 mg	tablet	48	81.7	104	34.4	3.83	0.910

Showing just the first three rows

The appeaance of the notes can be controlled by calling noteconf() and passing the result as note_config. See ?tab_notes() for more details.

1.7.2 Units

pmtables can automatically place units underneath the appropriate column. To do this, generate a list with names that match the column names you want to label with units.

```
u <- list(
   WT = "kg", CRCL = "ml/min", AGE = "year", ALB = "g/dL",
   SCR = "mg\\%"
) %>% map(~paste0("(", .x, ")"))
```

Then pass that list as units to stable()

```
stable(data, units = u) %>% st_asis()
```

				T 4 77 E	CDCI	ACE	AID	
OTHERN	DOCE	EODM.	N. T	WT	CRCL	AGE	ALB	SCR
STUDY	DOSE	FORM	N	(kg)	(ml/min)	(year)	(g/dL)	(mg%)
12-DEMO-001	100 mg	tablet	80	71.4	104	33.7	4.20	1.06
12-DEMO-001	150 mg	capsule	16	89.4	122	24.4	4.63	1.12

12-DEMO-002	75 mg	troche	36	73.6	103	49.2	4.52	0.930

1.7.3 Multi-line column headers

If the column header is long, you can break it across multiple lines. By default, use . . . in the column name

```
tibble(`First line ... Second line` = 123456789) %>%
  stable() %>% st_asis()
```

First line Second line 123456789

The break can be introduced through the rename mechanism

```
tibble(a = 1) %>%
  stable(cols_rename = c(`First ... Second` = "a")) %>%
  st_asis()
```

First Second

Look at the <code>?tab_cols</code> help topic for the <code>cols_break</code> argument; this lets you change the character sequence used for the break.

2 Group table rows with panel

2.1 Syntax

To panel a table by STUDY

```
stable(stdata(), panel = "STUDY")
```

To set a prefix for the panel header:

```
stable(stdata(), panel = as.panel("STUDY", prefix = "Study: "))
```

2.2 Basics

Paneling your table is a way to group sets of rows together into a "panel" with a panel header rendered in bold font. For example, we can panel a table of mtcars by carb. We will be working with an abbreviated version of mtcars:

```
smcars
```

```
name mpg cyl disp hp drat
                                                    wt qsec vs am gear
. Datsun 710
                Datsun 710 22.8 4 108.0 93 3.85 2.320 18.61 1 1
                                                                    4
. Hornet 4 Drive Hornet 4 Drive 21.4 6 258.0 110 3.08 3.215 19.44 1 0
                                                                    3
. Valiant
                   Valiant 18.1 6 225.0 105 2.76 3.460 20.22 1 0
. Fiat 128
                   Fiat 128 32.4 4 78.7 66 4.08 2.200 19.47 1 1
. Toyota Corolla Toyota Corolla 33.9 4 71.1 65 4.22 1.835 19.90 1 1
. Toyota Corona Toyota Corona 21.5 4 120.1 97 3.70 2.465 20.01 1 0
               Fiat X1-9 27.3 4 79.0 66 4.08 1.935 18.90 1 1
. Fiat X1-9
. Merc 240D
                  Merc 240D 24.4 4 146.7 62 3.69 3.190 20.00 1 0
. Merc 230
                   Merc 230 22.8 4 140.8 95 3.92 3.150 22.90 1 0
                                                                    4
. Honda Civic
               Honda Civic 30.4 4 75.7 52 4.93 1.615 18.52 1 1
              carb
. Datsun 710
                 1
. Hornet 4 Drive
                 1
. Valiant
. Fiat 128
                1
. Toyota Corolla
                 1
. Toyota Corona
                 1
. Fiat X1-9
                 2
. Merc 240D
. Merc 230
                 2
. Honda Civic
                 2
```

Then we pass into stable() and name the paneling column:

```
smcars %>% stable(panel = "carb") %>% st_asis()
```

name	mpg	cyl	disp	hp	drat	wt	qsec	vs	am	gear
1										
Datsun 710	22.8	4	108	93	3.85	2.32	18.61	1	1	4
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3
Valiant	18.1	6	225	105	2.76	3.46	20.22	1	0	3
Fiat 128	32.4	4	78.7	66	4.08	2.2	19.47	1	1	4
Toyota Corolla	33.9	4	71.1	65	4.22	1.835	19.9	1	1	4
Toyota Corona	21.5	4	120.1	97	3.7	2.465	20.01	1	0	3
Fiat X1-9	27.3	4	79	66	4.08	1.935	18.9	1	1	4
2										
Merc 240D	24.4	4	146.7	62	3.69	3.19	20	1	0	4
Merc 230	22.8	4	140.8	95	3.92	3.15	22.9	1	0	4
Honda Civic	30.4	4	75.7	52	4.93	1.615	18.52	1	1	4

Now, all of the carb==1 rows are grouped with the heading 1 and similarly the carb==2 rows are grouped with the heading 2 in bold.

This is ok, but a more informative heading would be helpful. To do this, we'll call as . panel() to both name the panel column and set some options:

```
smcars %>% stable(panel = as.panel("carb", prefix = "carb: ")) %>% st_asis()
```

name	mpg	cyl	disp	hp	drat	wt	qsec	vs	am	gear
carb: 1										
Datsun 710	22.8	4	108	93	3.85	2.32	18.61	1	1	4
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3
Valiant	18.1	6	225	105	2.76	3.46	20.22	1	0	3
Fiat 128	32.4	4	78.7	66	4.08	2.2	19.47	1	1	4
Toyota Corolla	33.9	4	71.1	65	4.22	1.835	19.9	1	1	4
Toyota Corona	21.5	4	120.1	97	3.7	2.465	20.01	1	0	3
Fiat X1-9	27.3	4	79	66	4.08	1.935	18.9	1	1	4
carb: 2										
Merc 240D	24.4	4	146.7	62	3.69	3.19	20	1	0	4
Merc 230	22.8	4	140.8	95	3.92	3.15	22.9	1	0	4
Honda Civic	30.4	4	75.7	52	4.93	1.615	18.52	1	1	4

Note that the prefix is completely specified by the user (including any spaces or a colon.

2.3 panel: important points

- 1. Most of the time, the data frame should be sorted by the panel column
- 2. pmtables creates panels by non-repeating values in the panel column; there will be an error if duplicate panel names are found and this can be overridden by passing duplicates_ok to as.panel().

3 Group table columns with spanners

3.1 Syntax

Set the span arument to the output of as.span(). The key arguments for as.span() are the spanner title and the names of the columns over which you want the spanner to run

```
stable(stdata(), span = as.span("Covariates", WT:SCR))
The equivalent pipe syntax is
st_new(stdata()) %>% st_span("Covariates", WT:SCR)
```

3.2 Basics

A column spanner puts a horizontal line over a sequence of column names and places a title above that line forming a column group.

As a trivial example:

```
data <-
  tibble(
   Tariffville = "06081", Connecticut= "CT",
   Minnesota = "MN", Minneapolis = "55455"
)
data %>% stable(span = as.span("States", Connecticut:Minnesota)) %>% st_asis()
```

	States							
Tariffville	Connecticut	Minnesota	Minneapolis					
06081	CT	MN	55455					

3.3 Multiple spanners

Multiple spanners can be added to a table by specifying the level for any spanner that you want to be placed above the lowest level spanner. For example,

```
sp <- list(
  as.span("States", Connecticut:Minnesota),
  as.span("The Universe", Tariffville:Minneapolis, level = 2)
)
data %>% stable(span = sp) %>% st_asis()
```

The Universe									
States									
Tariffville	Connecticut	Minnesota	Minneapolis						
06081	CT	MN	55455						

Note that to specify multiple spanners, we pass a list of span objects. I've simplified the code a bit here by creating that list as a standalone object and then passing the whole list as span.

3.3.1 Using pipe syntax

For problems like this, it might be preferable to use the pipe syntax

```
data %>%
  st_new() %>%
  st_span("States", Connecticut:Minnesota) %>%
  st_span("The Universe", Tariffville:Minneapolis, level = 2) %>%
  stable() %>%
  st_asis()
```

The Universe									
	Stat	States							
Tariffville	Connecticut	Minnesota	Minneapolis						
06081	CT	MN	55455						

3.4 Breaking span title

We can make the title of the span break across multiple lines by using . . .

```
stable(data, span = as.span("Example ... States", Connecticut:Minnesota)) %>%
st_asis()
```

	Exam Stat		
Tariffville	Connecticut	Minnesota	Minneapolis
06081	CT	MN	55455

4 Tables that span multiple pages: longtable

4.1 Syntax

To create a long table from a data frame

```
stable_long(stdata())
```

To create a long table from pipeline

```
st_new(data) %>% stable_long()
```

To create a long table from pmtable

```
pt_cont_long(data, cols = "WT,EGFR") %>% stable_long()
```

4.2 Basics

You can create longtables that span multiple pages of your pdf document. Tables using thelongtable environment are very different than the basic table from stable() which are built using tabular environment.

4.3 Inserting longtable into your latex document

Once you have written your long table out to a file, you can source it into your latex document with a simple input command

```
\input{my-table.tex}
```

You should not wrap your longtable input code in \begin{table}/\end{table} as you would with a regular table.

5 The pipe interface

5.1 Basics

Mostly working with this data; but some others come in later to illustrate certain features.

```
data <- pmt_summarized
head(data)</pre>
```

```
. # A tibble: 6 x 9
   STUDY
            DOSE FORM
                                      CRCL AGE
                                                 ALB
          <chr> <chr> <chr> <chr> <chr> <chr> <chr> <chr> <chr> <chr>
   <chr>
. 1 12-DEMO-001 100 mg tablet 80 71.4 104
                                            33.7 4.20 1.06
. 2 12-DEMO-001 150 mg capsule 16 89.4 122
                                            24.4 4.63 1.12
. 3 12-DEMO-001 150 mg tablet 48 81.7 104
                                            34.4 3.83 0.910
. 4 12-DEMO-001 150 mg troche 16 94.0 93.2 27.4 4.94 1.25
. 5 12-DEMO-001 200 mg tablet 64 67.9 100 27.5 4.25 1.10
. 6 12-DEMO-001 200 mg troche 16 76.6 99.2 22.8 4.54 1.15
```

You start out a pipline by passing your data frame into st_new()

```
data %>% st_new() %>% class
```

```
. [1] "stobject" "environment"
```

This creates an object that gets revised by subsequent steps in the pipeline, adding features and styling as you go.

For the final step in the pipeline, we'll send the object to stable() to create the table

```
data %>% st_new() %>% stable() %>% head(n=9)
```

- . [1] "\\setlength{\\tabcolsep}{5pt} "
- . [2] "\\begin{threeparttable}"
- . [3] "\\renewcommand{\\arraystretch}{1.3}"
- . [4] "\\begin{tabular}[h]{llllllll}"
- . [5] "\\hline"
- . [6] "STUDY & DOSE & FORM & N & WT & CRCL & AGE & ALB & SCR \\\"
- . [7] "\\hline"
- . [8] "12-DEMO-001 & 100 mg & tablet & 80 & 71.4 & 104 & 33.7 & 4.20 & 1.06 \\\"
- . [9] "12-DEMO-001 & 150 mg & capsule & 16 & 89.4 & 122 & 24.4 & 4.63 & 1.12 \\\"

5.2 Simple table

You can terminate the pipeline and create a tabular table by sending to stable()

```
data %>% st_new() %>% stable()
```

Equivalent call

```
data %>% stable()
```

5.3 Long table

You can also pipe to stable_long() to make a long table

```
data %>% st_new() %>% stable_long()
```

5.4 Annotate with file names

```
st_new(data) %>% st_files(r = "foo.R", output = "foo.tex")
```

Equivalent call

```
stable(data, r_file = "foo.R", output_file = "foo.tex")
```

Note that in the pipe version, we already have file in the function name so that gets dropped from the argument name.

5.5 Save a table

First convert with stable() or stable_long() then save with stable_save()

```
st_new(data) %>%
st_files(output = "foo.tex") %>%
stable() %>%
stable_save()
```

5.6 Align columns

```
• st_center(...)
• st_left(...)
• st_right(...)
• st_align(...)

st_new(data) %>%
  st_center() %>%
  stable()
```

Equivalent call

```
stable(data, align = cols_center())
```

5.7 Rename columns

```
st_new(data) %>%
st_rename(Weight = "WT") %>%
stable()
```

Equivalent call

```
stable(data, cols_rename = c(Weight = "WT"))
```

5.8 Blank columns

```
st_new(data) %>% st_blank(WT, ALB, DOSE) %>% stable()
```

Equivalent call

```
stable(data, cols_blank = "WT,ALB,DOSE")
```

5.9 Drop columns

```
st_new(data) %>% st_drop(WT, ALB, DOSE) %>% stable()
```

Equivalent call

```
stable(data, drop = "WT, ALB, DOSE")
```

5.10 Notes

• Multiple calls are allowed; notes will accumulate

```
st_new(data) %>%
st_notes("first note") %>%
st_nates("second note") %>%
stable()
```

Equivalent call

```
stable(
  data,
  notes = c("first note", "second note")
)
```

5.11 Units

```
st_new(data) %>%
st_units(WT = "kg", AGE = "years") %>%
stable()
```

Note that st_units() will automatically add parens to your units; this can be suppressed with the parens argument.

Units can also be added as a list

```
u <- list(WT = "kg", AGE = "years")
st_new(data) %>%
  st_units(u) %>%
  stable()
```

Equivalent call

```
stable(data, units = u)
```

5.12 panel

```
st_new(data) %>%
st_panel("STUDY") %>%
stable()
```

Equivalent call

```
stable(data, panel = "STUDY")
```

5.13 span

```
st_new(data) %>%
st_span("Covariates", c(WT, ALB, EGFR)) %>%
stable()
```

Equivalent call

```
stable(data, span = as.span("Covariates", c(WT, ALB, EGFR)))
```

5.14 hlines - at

To put horizontal lines at specific rows

```
st_new(data) %>% st_hline(at = c(2,4,6))
```

Equivalent call

```
stable(data, hline_at = c(2,4,6))
```

5.15 hlines - from

To calculate hlines based on data frame column values (for example, to break the table by changing values of STUDYf)

```
st_new(data) %>% st_hline(from = "STUDYf")
```

Equivalent call

```
stable(data, hline_from = "STUDYf")
```

5.16 hlines - pattern

To search the table for a pattern and add hlines above matches

```
st_new(data) %>% st_hline(pattern = "All", cols = "Summary")
```

```
. # A tibble: 13 x 9
    STUDY
            DOSE
                     FORM
                             N
                                   WT
                                        CRCL AGE
                                                    ALB
                                                         SCR

. 9 12-DEMO-002 50 mg capsule 36
                                  74.1 112
                                              37.1 4.44 0.900
. 10 12-DEMO-002 50 mg
                     tablet 324
                                  71.2 106
                                              34.1 4.63 0.868
. 11 12-DEMO-002 75 mg capsule 36
                                  72.4 105
                                              38.2 3.89 0.900
                                  71.6 98.9 34.2 4.49 0.991
. 12 12-DEMO-002 75 mg tablet 288
. 13 12-DEMO-002 75 mg troche 36
                                   73.6 103
                                              49.2 4.52 0.930
```

The cols argument limits the search to the Summary column; omit this argument to search the whole table.

There is no equivalent call for this using straight stable().

6 Options for previewing the table

6.1 st2report

Take a table or a list of tables and render them in a report-like document with a table of contents and a (faux) caption for each table

```
data %>% stable() %>% st2report()
```

You might try passing ntex to force the document to build more than once (sometimes the layout settles down after the second build

```
data %>% stable() %>% st2report(ntex = 2)
```

Pass in a list of tables and you will get one table on each page with a listing of tables in the table of contents

```
list(table1, table2, table3) %>% st2report()
```

6.2 st2viewer

This function relies on texPreview() to render your table and display it as a graphic in the viewer window

```
data %>% stable() %>% st2viewer()
```

This method is more conveient because the tables always go to the viewer. But the rendering will not be like what you will see in the report.

6.3 st2article

Like st2report() but less report-like. You should use st2report() instead.

```
data %>% stable() %>% st2article()
```

6.4 st2doc

The original. Rather than building a TeX article, it runs the table in a Rmd document via pandoc. Not recommended; it is much slower to get the preview because there has to be a call to pandoc

```
data %>% stable() %>% st2doc()
```

7 A word about sanitizing table contents

7.1 Notes

```
x <- ptdata() %>% st_new(notes = "EDA_summary = TRUE") %>%
  st_make(inspect = TRUE) %>%
  get_stable_data()

x$notes
```

. [1] "EDA_summary = TRUE"

7.2 File names

```
x <- ptdata() %>% st_new() %>%
  st_files(r = "my_script.R") %>%
  st_make(inspect = TRUE) %>%
  get_stable_data()
x$notes
```

. [1] "Source code: my_script.R"

7.3 Column names

```
out <-
  tibble(a_1 = 5) %>%
  stable(inspect = TRUE) %>%
  get_stable_data()

out$cols_tex
```

. [1] "a_1 \\\\"

7.4 Main table contents

```
out <-
  tibble(a = "5_2") %>%
  stable(inspect = TRUE) %>%
  get_stable_data()
out$tab
```

. [1] "5_2 \\\\"

7.5 Span titles

```
out <-
  ptdata() %>%
  stable(inspect = TRUE, span = colgroup("foo_this", WT:SCR)) %>%
  get_stable_data()
out$span_data$tex
```

- . [1] "\\multicolumn{4}{c}{} & \\multicolumn{5}{c}{foo}_this} \\\\"
- $[2] "\cmidrule(lr){5-9}"$

7.6 Panel names

- . [1] "\\multicolumn $\{1\}\{l\}\{\t \{a\t 1\}\}\t$ "
- . [2] "\\hline \\multicolumn{1}{1}{\\textbf{a_2}}\\\\"

7.7 cols_extrainput

```
x <- letters[1:5]
data <- tibble(a = x, b = x, c = x)
xtra <- tibble(a = "foo%", b = "$\\mu$g", c = "1234 \\% %")
out <- stable(data, cols_extra = xtra)
out[grepl("%", out, fixed = TRUE)]</pre>
```

. [1] "foo\\% & \$\\mu\$g & 1234 \\% % \\\\"

8 pmtable

Some setup

```
units = ys_get_unit(ys_help$spec(), parens = TRUE)

data <- pmt_first
data_pk <- pmt_pk
data_all <- pmt_obs</pre>
```

8.1 Data inventory tables

- · Count number of
 - individuals
 - observations
 - BQL observations
 - missing values
- Calculate the percent of observations or BQL in different sub groups

8.1.1 Stacked by endpoint

• The stacked plot creates multiple independent tables to summarize different endpoints; there is no single overall summary for the table because we are summarizing different endpoints

```
out <- pt_data_inventory(
  data_all,
  by = c(Study = "STUDYf"),
  panel = as.panel("SEQf", prefix = "Endpoint: "),
  stacked = TRUE
)

out %>% stable(r_file = "test.R", output_file = "test.tex") %>% st_asis()
```
